

1 Do not call it User Experience, call it Experience: we need to think beyond the singular human experience.

In the context of the transformation economy, **understanding the user experience** requires considering **two perspectives: societal and beyond the human being**. Historically, society prioritized **individualism**, designing products and services for single users to drive financial growth. However, as we shift towards the transformation economy, questioning the necessity of sole ownership arises. Designing for this new paradigm entails **moving beyond individualistic views to consider the complete societal experience**, ensuring inclusivity and addressing impacts on groups. Moreover, in a global context, designers must also **incorporate the experiences of other living beings and the environment**, recognizing the interconnectedness of stakeholders beyond just human individuals. In essence, the transformation economy encompasses a broader spectrum of stakeholders, requiring a holistic approach to design that goes **beyond singular human experiences**.

“DID YOU CONSIDER MORE THAN HUMAN EXPERIENCE?”

2 Experience Design is not material focus; it is systematic.

As we move towards a post-materialistic society, we realize that to resolve large environmental and societal problems, as well as problems in our daily lives, creating more products does not help. The **solution lies in developing durable systems** that grasp the complexity of our era and help solve our current problems.

Experience Design **does not focus on tangible, physical elements** but on the **systematic approach** to creating and shaping users' overall experience. It emphasizes the structured and intentional design of interactions, processes, and environments to enhance the quality of the experience. Products may still be developed, but only as mediators and facilitators of these experiences, and not as starting point of the development.

“IS YOUR PRODUCT A MEDIATOR OR FACILITATOR OF THE EXPERIENCE?”

3 In the Transformation Economy Experience Design is a vessel to understand complexity in societal and environmental issues.

In the Transformation economy, companies **prioritize local customization over global standardization**, fostering **trust** within resilient value networks that resist disruption. **Trusted relationships**, unlike past paradigms, are **resistant to replication or cost-based competition**.

Experience Design plays a role by **understanding local environments and addressing social, cultural, and environmental issues**. Tailored solutions **promote behavioural changes** necessary for driving the Transformation economy. Furthermore, fostering relationships with local partners, companies increase their chances of success and earn respect within valued networks. Experience Design **intervenes through empathy**, helping in the **communication** to translate user behaviours into tailored solutions that promote change.

“DO YOU THINK FROM LOCAL TO GLOBAL IMPLEMENTATION?”

DON'T SAY USER EXPERIENCE, SAY EXPERIENCE

“More than user experience, Experience Design in the transformation economy paradigm. [1] [2]”

We currently reside in the Knowledge Economy paradigm [1], yet subtle indications suggest a transition towards a Transformation economy paradigm [2]. As our society progresses, so do our values and needs, prompting us to look closer at the significance of User Experience (UX).

The transformation economy is distinguished by the **recognition of our planet's plight** and the **urgent need for change** before reaching a point of extinction. Society begins to **challenge the human-centered vision** of previous decades. Entrepreneurs and corporations are **exploring new business models focused on social and environmental impact**. Social innovation and ventures **turn challenges into market opportunities**, transforming business practices towards ethical and fair value creation. Companies are piloting collaborative ventures to refine these models.

Hence, through this Manifesto, we question the actual use of the term User Experience, as we interpret user as a reference to the human experience. We see the shift of this concept towards a more global meaning that incorporates a **more then human experience**, therefore we should refer to this phenomenon as Experience. We propose six guidelines to start adapting to the new paradigm.

4 In the transformation economy, designers are the moderator of change.

Experience design plays a pivotal role in **driving change**, especially when it comes to **shaping user behaviours within established systems**. In the Transformation Economy, designers assume the role of **change facilitators**, underscoring the importance of establishing **trust and transparent communication** channels among all stakeholders involved. Essential to this process is the **clear articulation of the design's intended message**, a task that requires careful consideration of various factors including past experiences, societal norms, contextual nuances, and current behavioural patterns. By **acknowledging and addressing these influences**, designers can foster an environment of open dialogue and effectively guide stakeholders towards desired outcomes through thoughtfully crafted designs.

“DID YOU THINK ABOUT THE FACTORS THAT AFFECTS PERCEPTION TO DESIGN A CLEAR MESSAGE?”

6 Experience Design will empower incremental societal change by building on past experiences.

Experience has an important role in driving transformation within systems. **It stresses the need for gradual adaptation to new experiences, building new perspectives on existing norms, and understanding the current environment deeply**. Designers play a key role in guiding systems towards embracing new perspectives by leveraging their understanding and employing strategies aligned with the principles of the Transformation Economy. In essence, **Experience design is key in strategic implementation for a effecting positive change within systems**.

“IS EXPERIENCE AN ELEMENT FOR INCREMENTAL CHANGE?”

5 In Experience Design, designers need to think about first person perspective for better understanding.

Emotions, behaviours, and needs play a crucial role in our interactions. **Designers need to empathize with users**, seeing things from their perspective. The understanding of the user through **empathy helps the designer to position themselves** in the position of the target group and therefore enrich his first-person perspective with the experiences of the user. This is central in Experience Design, fostering insights and bridging gaps between designers and users. It is key for observing potential transformations and driving system enhancements.

Understanding behaviours, needs, and decision-making is crucial for effective design. Yet, the personal connection gained through empathy fuels designers' passion for their work. In the transformation economy, keeping this **first-person approach ensures designers remain connected to their user, driving positive and meaningful change**.

“DID YOU THINK ABOUT YOURSELF AS A USER IN THE SYSTEM?”
